

RECYCLED MATERIAL

A recycled thermoplastic technopolymer obtained from pure waste material that has been set aside and is not contaminated by other materials.

The choice is dictated by the possibility to use scrap material that guarantees the aesthetic quality and structural requirements of the product, reducing the emissions necessary for its production.

With this material, Kartell intends to go one step further in its commitment to environmental sustainability, using recycled material while eliminating waste from the environment and turning it back into raw material, activating a virtuous process of circular economy.
